

PROJECT CASE STUDY

The impressive property shows very extensive use of cast stone.

Walling, balustrades, window surrounds, string courses, treads, copings and band courses are all cast stone.

Even more close-up the cast stone is entirely convincing in the way it replicates natural stone.

Residential Property Extension Using Multiple Cast Stone Architectural Features

Location of Project
Lincolnshire

Project Overview

The original property was greatly extended, with the existing façade removed and then the building's boundaries extended both outwards and upwards. The use of cast stone was extensive, with walling, balustrade, window surrounds, string courses, treads, copings and band courses all incorporated into the impressive new property. Even the dormer windows have cast stone surrounds which is fairly unusual.

Project Notes

This is a great example of how cast stone can be used to convincingly replicate natural stone and at a fraction of the cost.

What did the client say

"The cast stone looks magnificent and we are very pleased with the overall result."
