Golf ball specifications:

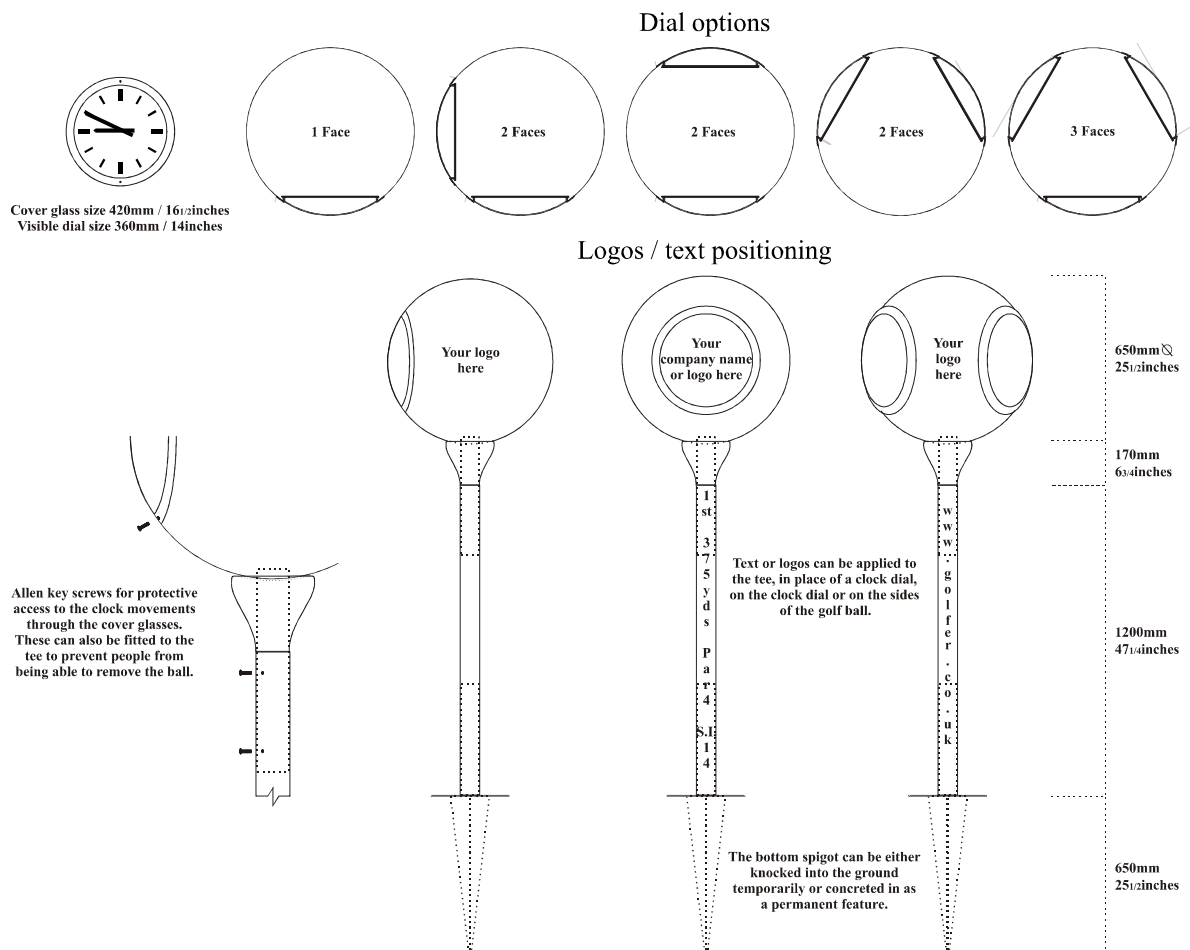

The golf ball is made from GRP with scaled realistic dimples. The balls can be personalised in many ways including logos and text applied to the ball itself, as background to a clock dial or in place of a clock dial. This is an eye catching way of displaying details of a sponsor, club, major competition or course information, which can be changed as required.

The dial cover glasses are made in clear UV stable PETG (high impact acrylic) and are fitted with Allen key screws to allow for easy access to the clock movements and controllers.

The tee and spigots are made from Aluminium. The tee can be personalised with text and finished in a colour from our standard range of red, blue, green, yellow, black and white or we can colour match it to the logos or text on the ball.

The clock movements are mains or lithium battery powered and can be controlled by various systems for use all around the world working from the DCF, MSF or WWVB time signals. Where these time signals are not available a GPS worldwide signal receiver can be supplied. The controllers keep the clocks synchronised with each other and at the correct time, and can also automatically adjust for summer and winter time changes.

Dials can be custom made to suit a particular image. Seconds hands can be added for time keeping accuracy or we can replace a dial with a temperature display and even offer a combined time and temperature display.
