Rainwater Hoppers

VATKR and VATKL

Rainwater hoppers, or hopper heads, were traditionally designed to increase the flow of a drainpipe in heavy rainfall. Pipes usually run only a third full; using a hopper creates a symphonic system causing the pipe to fill to capacity,

Now, hoppers are more typically used where a standard outlet connection to drainpipe wouldn't be suitable such as where a water spout is used or multiple gutter runs that need to run into one pipe.

The VATKR regular hopper is rectangular fronted with square sides and provides a practical solution for standard applications. The VATKL large hopper is a more ornate inverted pyramid shape and has a larger capacity.
