17/5397 Product Sheet 1

RADMAT PROTHERM G INVERTED ROOF INSULATION FOR FLAT ROOFS

XENERGY SL-EP INVERTED ROOF INSULATION

This Agrément Certificate Product Sheet⁽¹⁾ relates to XENERGY SL-EP Inverted Roof Insulation, extruded polystyrene (XPS) boards for use in the inverted roof concept (above the roof waterproofing) on untrafficked flat roofs, and balconies and terraced roofs subject to pedestrian access only, with either zero pitch or slopes between 1:80 and 1:6. The product is used in conjunction with XENERGY MK, a filter/water-control membrane, between the insulation and the ballast layer, forming the XENERGY MinK system.

(1) Hereinafter referred to as 'Certificate'.

CERTIFICATION INCLUDES:

- factors relating to compliance with Building Regulations where applicable
- · factors relating to additional non-regulatory information where applicable
- independently verified technical specification
- · assessment criteria and technical investigations
- design considerations
- installation guidance
- regular surveillance of production
- formal three-yearly review.

KEY FACTORS ASSESSED

Thermal performance — the product can contribute towards the thermal performance of a roof. The design thermal conductivity (λ_{u}), including moisture correction factor, of the product is 0.032 W·m⁻¹·K⁻¹ for 80 mm board thickness and $0.033 \text{ W} \cdot \text{m}^{-1} \cdot \text{K}^{-1}$ for 100 mm to 205 mm thicknesses (see section 6).

Condensation risk — the product can contribute to limiting the risk of surface and interstitial condensation (see section 7). **Resistance to foot traffic** — the product, when installed on appropriate decks finished with a gravel ballast layer or paving slabs, can be used on flat roofs with limited pedestrian access associated with maintenance operations, and pedestrian access roofs (on balconies and roof terraces) subject to foot traffic only (see section 8).

Durability — the product will remain effective as an insulant for at least 25 years, as long as the XENERGY MK (water-control membrane) is in place (see section 12).

The BBA has awarded this Certificate to the company named above for the product described herein. This product has been assessed by the BBA as being fit for its intended use provided it is installed, used and maintained as set out in this Certificate.

On behalf of the British Board of Agrément

Date of First issue: 16 February 2017

Regulations

In the opinion of the BBA, XENERGY SL-EP Inverted Roof Insulation, if installed, used and maintained in accordance with this Certificate, can satisfy or contribute to satisfying the relevant requirements of the following Building Regulations (the presence of a UK map indicates that the subject is related to the Building Regulations in the region or regions of the UK depicted):

E Company	The Building Regulations 2010 (England and Wales) (as amended)	
Requirement: Comment:	C2(c)	Resistance to moisture The product can contribute to satisfying this Requirement. See sections 7.4 and 7.5 of
		this Certificate.
Requirement:	L1(a)(i)	Conservation of fuel and power
Comment:		The product can contribute to satisfying this Requirement. See sections 6.1 and 6.3 of this Certificate.
Regulation:	7	Materials and workmanship
Comment:		The product is acceptable. See section 12.1 and the <i>Installation</i> part of this Certificate.
Regulation:	26	CO ₂ emission rates for new buildings
Regulation:	26A	Fabric energy efficiency rates for new dwellings (applicable to England only)
Regulation: Regulation:	26A 26B	Primary energy consumption rates for new buildings (applicable to Wales only) Fabric performance values for new dwellings (applicable to Wales only)
Comment:	200	The product can contribute to satisfying these Regulations. See sections 6.1 and 6.3 of this Certificate.

Den 1	The Building (Scotland) Regulations 2004 (as amended)		
Regulation: Comment:	8(1)(2)	Durability, workmanship and fitness of materials The product is acceptable. See sections 11.1 and 12.1 and the <i>Installation</i> part of this Certificate.	
Regulation: Standard: Comment:	9 3.15	Building standards applicable to construction Condensation The product can contribute to satisfying this Standard, with reference to clauses $3.15.1^{(1)(2)}$, $3.15.3^{(1)(2)}$, $3.15.4^{(1)(2)}$, $3.15.5^{(1)(2)}$ and $3.15.6^{(1)(2)}$. See sections 7.4 and 7.6 of this Certificate.	
Standard: Standard: Comment:	6.1(b) 6.2	Carbon dioxide emissions Building insulation envelope The product can contribute to satisfying these Standards, with reference to clauses, or parts of, $6.1.1^{(1)}$, $6.1.2^{(1)(2)}$, $6.1.4^{(1)(2)}$, $6.1.5^{(1)}$, $6.1.6^{(1)(2)}$, $6.1.7^{(2)}$, $6.1.8^{(2)}$ to $6.1.10^{(2)}$, $6.2.1^{(1)(2)}$, $6.2.2^{(1)}$, $6.2.3^{(1)(2)}$, $6.2.4^{(1)(2)}$, $6.2.5^{(2)}$, $6.2.6^{(1)(2)}$ to $6.2.11^{(1)(2)}$, $6.2.12^{(2)}$ and $6.2.13^{(1)(2)}$. See sections 6.1 and 6.3 of this Certificate.	
Standard: Comment:	7.1(a)(b)	Statement of sustainability The product can contribute to satisfying the relevant requirements of Regulation 9, Standards 1 to 6, and therefore will contribute to a construction meeting a bronze level of sustainability as defined in this Standard. In addition, the product can contribute to a construction meeting a higher level of sustainability as defined in this Standard, with reference to clauses 7.1.4 ⁽¹⁾⁽²⁾ [Aspects 1 ⁽¹⁾⁽²⁾ and 2 ⁽¹⁾], 7.1.6 ⁽¹⁾⁽²⁾ [Aspects 1 ⁽¹⁾⁽²⁾] and 7.1.7 ⁽¹⁾⁽²⁾ [Aspect 1 ⁽¹⁾⁽²⁾]. See sections 6.1 and 6.3 of this Certificate.	

Regulation: Comment:	12	 Building standards applicable to conversions All comments given for the product under Regulation 9, Standards 1 to 6, also apply to this Regulation, with reference to clause 0.12.1⁽¹⁾⁽²⁾ and Schedule 6⁽¹⁾⁽²⁾. (1) Technical Handbook (Domestic) (2) Technical Handbook (Non-Domestic). 	
in the second	The Building Regulations (Northern Ireland) 2012 (as amended)		
Regulation: Comment:	23	Fitness of materials and workmanship The product is acceptable. See section 12.1 and the <i>Installation</i> part of this Certificate.	
Regulation: Comment:	29	Condensation The product can contribute to satisfying this Regulation. See section 7.4 of this Certificate.	
Regulation: Comment:	39(a)(i)	Conservation measures The product can contribute to satisfying this Regulation. See sections 6.1 and 6.3 of this Certificate.	
Regulation: Comment:	40(2)	Target carbon dioxide emission rate The product can contribute to satisfying this Regulation. See sections 6.1 and 6.3 of this Certificate.	

Construction (Design and Management) Regulations 2015 Construction (Design and Management) Regulations (Northern Ireland) 2016

Information in this Certificate may assist the client, designer (including Principal Designer) and contractor (including Principal Contractor) to address their obligations under these Regulations.

See sections: 3 Delivery and site handling (3.4) and Installation (13.2) of this Certificate.

Additional Information

NHBC Standards 2017

NHBC accepts the use of XENERGY SL-EP Inverted Roof Insulation, provided it is installed, used and maintained in accordance with this Certificate, in relation to *NHBC Standards*, Chapter 7.1 *Flat roofs and balconies*.

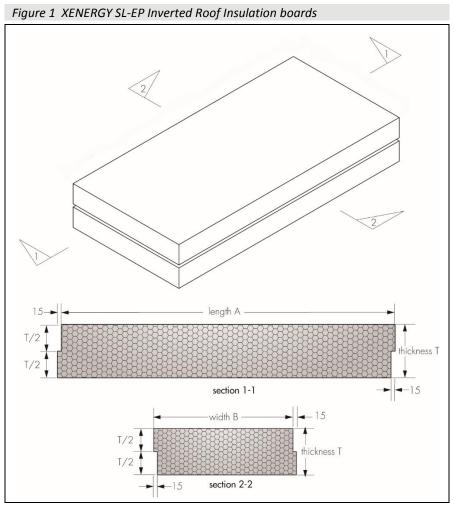

CE marking

The manufacturer has taken the responsibility of CE marking the product in accordance with harmonised European Standard BS EN 13164 : 2012. An asterisk (*) appearing in this Certificate indicates that data shown is given in the manufacturer's Declaration of Performance.

Technical Specification

1 Description

1.1 XENERGY SL-EP Inverted Roof Insulation comprises extruded polystyrene (XPS) foam boards, available in two standard sizes and rebated for lap jointing (see Figure 1). The boards are used in conjunction with XENERGY MK, a filter/water-control membrane, and are for use with a gravel ballast or paving finish.

Length A	Width B	Thickness T
(mm)	(mm)	(mm)
1250	600	80, 100, 120,
		140, 160, 180
2500	600	200, 205

1.2 The product has the nominal characteristics shown in Table 1.

Nominal characteristics	
Minimum compressive strength at 10% compression* (kPa)	300
Minimum density (kg⋅m ⁻³)	34
Work size – length x width (mm)	1250 x 600
Overall size – length x width (mm)	1265 x 615
Available thicknesses (mm)	80, 100, 120, 140, 160, 180
Work size – length x width (mm)	2500 x 600
Overall size – length x width (mm)	2515 x 615
Available thickness (mm)	200, 205
Edge detail	Rebated
	(15 mm x half board thickness)
Colour	Grey

1.3 XENERGY MK is used as a filter layer and water-control membrane between the insulation and the roof ballast layer. The nominal properties are shown in Table 2.

Table 2 Nominal characteristics of the XENERGY MK (water-control membrane)

Nominal characteristi	cs
Material type (vapour permeable membrane)	Non-woven spunbonded
	polyethylene
Roll sizes (m)	100 x 3
	50 x 1.5
Water vapour resistance (MN·s·g ⁻¹)	0.17
Head of water test (1.0 m)	No penetration
Mass per unit area (g·m ^{−2})	60
Lap joints (mm) — unsealed	300

1.4 Ancillary items outside the scope of this Certificate include:

- gravel ballast comprising a washed low fines aggregate, rounded and 16 mm to 32 mm in size (nominal), and laid to a minimum depth of 50 mm, or
- paving ballast of minimum 40 mm thickness. See section 9.2
- separating or cushion layers (if required see section 4.15)
- rainwater outlet grilles
- dual level rainwater outlets
- flashings and skirtings.

2 Manufacture

2.1 XENERGY SL-EP Inverted Roof Insulation boards are manufactured by a continuous extrusion process allowing a skin to form on the surfaces. Boards are then cut to size and rebates formed.

2.2 As part of the assessment and ongoing surveillance of product quality, the BBA has:

- agreed with the manufacturer the quality control procedures and product testing to be undertaken
- assessed and agreed the quality control operated over batches of incoming materials
- monitored the production process and verified that it is in accordance with the documented process
- evaluated the process for management of nonconformities
- checked that equipment has been properly tested and calibrated
- undertaken to carry out the above measures on a regular basis through a surveillance process, to verify that the specifications and quality control being operated by the manufacturer are being maintained.

2.3 The management system of the manufacturer has been assessed and registered as meeting the requirements of BS EN ISO 9001 : 2008 by BSI Management Systems (Certificate Number Q05968).

3 Delivery and site handling

3.1 The boards are shrink wrapped in polythene and delivered to site on pallets or bearers. Each pack shows the manufacturer's name, grade, type marking and BBA logo, incorporating the number of this Certificate.

3.2 The product must be protected from prolonged exposure to sunlight and should be stored under cover or protected with light-coloured opaque polythene sheets.

3.3 Care must be taken to avoid contact with solvents and materials containing organic components.

3.4 Boards must be stored flat, off the ground on a clean, level surface and under cover to protect them from high winds. They must not be exposed to open flame or other ignition sources.

3.5 Damaged boards must not be used.

Assessment and Technical Investigations

The following is a summary of the assessment and technical investigations carried out on XENERGY SL-EP Inverted Roof Insulation.

Design Considerations

4 Use

4.1 XENERGY SL-EP Inverted Roof Insulation is suitable for use as thermal insulation in the inverted roof concept (above the roof waterproofing) on inverted flat or zero pitch untrafficked roofs, and balconies and terraced roofs subject to pedestrian access only. The system is protected from wind uplift, UV degradation and maintenance foot traffic by paving or a gravel ballast layer.

4.2 For the purpose of this Certificate:

- flat roofs are defined as those roofs having either a minimum finished fall between 1:80 and 1:6, or zero pitch with finished falls from 0 to 1:80. For design purposes on sloping flat roofs, twice the minimum finished fall should be assumed, unless a detailed analysis of the roof is available, including overall and local deflection, direction of falls etc. See also *BBA Information Bulletin No 4*
- untrafficked roofs are defined as those roofs subject only to pedestrian traffic during installation of the system and to carry out maintenance of the roof covering and cleaning of gutters. Traffic in excess of the above criteria is outside the scope of this Certificate and special precautions, such as the use of higher compressive strength grade insulation and additional protection to the waterproofing membrane, will be necessary.

4.3 A roof ballast layer must be installed as work progresses, to protect the insulation boards and the XENERGY MK membrane from the effects of wind uplift and UV degradation. The ballasted roof finish may be either gravel ballast or paving, which must be assessed by a specialist for its suitability according to region exposure and building height. In addition, the dead load imposed by the finish must be allowed for in calculating the total acceptable load on the deck. Care must be taken to ensure that upgraded roofs are capable of carrying the increased load and depth of the installed system. Ballast must not be stacked in one place on the roof unless the roof is capable of supporting it.

4.4 Gravel ballast should be washed, rounded and 20/40 mm in size (nominal), and laid to a minimum thickness of 50 mm. The minimum size of ballast depends on the wind loads and parapet height to prevent wind scour of the ballast. The ballast should be installed in accordance with BS EN 1991-1-4 : 2005 and its UK National Annex.

4.5 The gravel ballast specification given in section 4.4 is suitable for sheltered regions, or buildings up to 10 storeys. On buildings up to 15 storeys, this specification may be used, but the perimeter must be loaded with paving determined by reference to BS EN 1991-1-2 : 2002. For other exposure conditions or tall buildings, specialist advice should be sought.

4.6 A paving finish ballast comprising a minimum 40 mm of standard pressed concrete paving slabs is suitable in sheltered regions and in buildings up to 15 storeys. For other exposure conditions or tall buildings, specialist advice should be sought. Pavings should be supported using proprietary spacer pads in accordance with the Certificate holder's recommendations.

4.7 XENERGY SL-EP Inverted Roof Insulation Boards must always be overlaid with the XENERGY MK membrane, which acts as a filter layer preventing fines and other debris from passing through and also as a water-control layer minimising cold rainwater flowing between the insulation and the roof waterproofing with consequent heat loss. This membrane may be covered with either a gravel ballast or paving finish.

4.8 The XENERGY MK water-control membrane is to be laid with 300 mm laps, overlapping in the downward direction of the flat roof slope. At upstands and penetrations, the membrane must be turned up to finish above the surface of the ballast layer and turned down at drainage outlets.

4.9 Concrete, metal or timber roofs should be designed in accordance with the relevant provisions of BS 6229 : 2003, BS 8217 : 2005 and BS 8218 : 1998, in particular to accommodate the weight of the ballast layer.

4.10 Decks should be covered with one or more of the following roof waterproofing specifications:

- built-up specifications using reinforced bitumen membranes to BS 8747 : 2007 in accordance with the recommendations of Table 5, and installed to the relevant clauses of BS 8217 : 2005
- mastic asphalt laid in accordance with BS 8218 : 1998
- other waterproofing systems which are the subject of a current Agrément Certificate, laid in accordance with, and within the limitations imposed by, that Certificate.

4.11 The roof must be designed with adequate falls unless the roof waterproofing system has been specifically designed and covered by a valid BBA Certificate for use in a zero pitch roof application. For zero pitch roofs it is particularly important to identify the correct drainage points, to ensure that drainage is sufficient and effective. Reference should be made to the appropriate clauses of the LRWA Guidance Note No 7 *Specifier guidance for flat roof falls,* which generally requires surface drainage falls in most situations.

4.12 It is essential that roof falls and drainage paths are correctly designed to avoid ponding and subsequent risk of silt build up, stresses in freezing conditions and to reduce water entry in the event of a failure in the waterproofing layer.

4.13 Dual level roof drainage should be provided in accordance with BS 6299 : 2003 and BS EN 12056-3 : 2000 to drain water off at the level of the XENERGY MK water-control membrane and also at the level of the roof waterproofing.

4.14 Drainage points need to be located at the lowest point of the roof, to facilitate the effective removal of rainwater. Care is needed to identify these locations. For example, precast concrete decks will deflect between spans, and mid-span may be the lowest point of the roof rather than roof edges or column supports.

4.15 Where there is a risk from plasticiser migration or other contaminants from the roof waterproofing (such as pvc single ply membranes), a suitable plastic fibre or similar isolating sheet must be interposed between the roof waterproofing and the insulation boards. For loose laid single layer roof waterproofing membranes, a cushion layer should be interposed.

4.16 Care must be taken to ensure that upgraded roofs are capable of carrying the increased load and depth of the installed system.

5 Practicability of installation

The product is designed to be installed by a competent general builder or contractor experienced with this type of product.

6 Thermal performance

6.1 Calculations of the thermal transmittance (U value) of a specific roof construction should be carried out in accordance with BS EN ISO 6946 : 2007 and BRE Report BR 443 : 2006, using the design thermal conductivity (λ_{U}) (including moisture correction factor), and the *fx* drainage factor for the system as given below. See also *BBA Information Bulletin No 4*:

- 0.032 W·m⁻¹·K⁻¹ design thermal conductivity (λ_U) (which is the declared lambda λ_D* with addition of moisture correction) for 80 mm thickness XENERGY SL-EP
 0.033 W·m⁻¹·K⁻¹ design thermal conductivity (λ_U) (which is the declared lambda λ_D* with addition of moisture correction) for 100 mm to 205 mm thickness XENERGY SL-EP
- fx = 0.001 drainage factor (incorporating the XENERGY MK water-control membrane).

The value of a completed roof will depend on the insulation thickness, and type of substrate and internal finish. When considering insulation requirements, designers should refer to the detailed guidance contained in the documents supporting the national Building Regulations. The U values shown in Table 3 indicate that the product can contribute to a roof achieving typical U values referred to in those supporting documents.

Table 3 Example U⁽²⁾ values for flat roof and zero pitch applications (incorporating the XENERGY MK watercontrol membrane)

Required	XENERGY	SL-EP	
U Value	Inverted Roof Insulation		
(W·m⁻²·K⁻¹)	Insulation thickness required ⁽³⁾		
	(mm)		
	$p^{(1)} \le 3$	p ⁽¹⁾ = 8	
0.13	120 + 120	140 + 120	
0.15	205	120 + 100	
0.16	200	205	
0.18	180	180	
0.20	160	160	
0.25	140	140	

(1) Values for p taken as examples of best to worst case for all UK locations.

(2) 200 mm dense concrete deck.

(3) Thickest board as bottom layer, when double layer used.

6.2 Rainfall reaching the roof waterproofing membrane will temporarily affect the rate of heat loss from the roof and should be accounted for by adding a correction (ΔU_r) to the calculated roof U value in accordance with Annex D.4 of BS EN ISO 6946 : 2007, as follows:

 $\Delta U_r = pfx (R_1/R_T)^2$ where:

 ΔU_r = correction to the calculated thermal transmittance of the roof element (W·m⁻²·K⁻¹).

 $p^{(1)}$ = average rate of precipitation during the heating season (mm·day⁻¹).

f = drainage factor giving the fraction of p reaching the waterproof membrane.

x = factor for increased heat loss caused by rainwater flowing on the membrane $(W \cdot day \cdot m^{-2} \cdot K^{-1} \cdot mm^{-1})$.

 R_1 = thermal resistance of the layer of the insulation above the waterproofing membrane (m²·K·W⁻¹).

 $R_{\rm T}$ = total thermal resistance of the construction before application of the correction (m²·K·W⁻¹).

fx = 0.001 for the system incorporating the XENERGY MK water-control membrane.

(1) Values for average rainfall during the heating season for different UK locations can be found at www.metoffice.gov.uk/climate/uk/averages/19611990/images/RainOctMar6190.gif and divided by 182 days to obtain 'p' in mm·day⁻¹.

Junctions

6.3 Care must be taken in the overall design and construction of junctions with other elements and openings to minimise thermal bridges and air infiltration. Detailed guidance can be found in the documents supporting the national Building Regulations.

7 Condensation risk

7.1 Warm water trapped under the boards is likely to be replaced by colder water during rainfall. Therefore, during heavy or continuous rainfall the roof waterproofing and the deck will be cooled. If condensation does occur it will be short-term, disappearing when the rain stops.

7.2 Risk of interstitial condensation will be minimal with concrete decks but metal and timber decks will be subjected to short periods of moisture; therefore timber must be treated with a suitable preservative in accordance with BS 8417 : 2011.

7.3 For systems using paving, a condensation risk analysis may be necessary using dynamic software in accordance with BS EN 15026 : 2007, depending on the climatic conditions existing in the location where it is installed.

Interstitial condensation

7.4 Roofs will adequately limit the risk of interstitial condensation when they are designed and constructed in accordance with BS 5250 : 2011, Section 4 and Annexes D and H. Further guidance may be obtained from BRE Report BR 262 : 2002.

Surface condensation

7.5 Roofs will adequately limit the risk of surface condensation when the thermal transmittance (U value) does not exceed 0.35 $W \cdot m^{-2} \cdot K^{-1}$ at any point and the junctions with walls are designed in accordance with section 6.3 of this Certificate.

7.6 Roofs will adequately limit the risk of surface condensation when the thermal transmittance (U value) does not exceed 1.2 $W \cdot m^{-2} \cdot K^{-1}$ at any point. Guidance may by obtained from BS 5250 : 2011, Annex H. Further guidance may be obtained from BRE Report BR 262 : 2002 and section 6.3 of this Certificate.

8 Resistance to foot traffic

When covered with a ballast layer, as specified in section 4, the product can accept the limited pedestrian foot traffic and light concentrated loads associated with installation and maintenance operations.

9 Behaviour in relation to fire

9.1 XENERGY SL-EP Inverted Roof Insulation boards have a reaction to fire classification* of Class E to BS EN 13501-1 : 2007.

9.2 When ballasted with either aggregate (minimum depth of 50 mm) or fully-supported cast stone or mineral slabs of at least 40 mm thickness, the roof may be considered to be of designation AA (low vulnerability in Scotland) and so is unrestricted by the national Building Regulations.

9.3 The designation of other roof covering specifications should be confirmed as required by the national Building Regulations.

9.4 XENERGY SL-EP Inverted Roof Insulation should not be laid over compartment walls.

10 Effect on roof coverings

10.1 The protected inverted roof system will provide solar protection and also limit the range of temperatures to which the waterproofing membrane will be subjected. Placing the insulation on top of the roof covering will normally lead to an extended life of the waterproof membrane.

10.2 Separation or cushion layers between the insulation boards and the roof waterproofing may be needed in some circumstances (see section 4.15 of this Certificate).

11 Maintenance

11.1 The inverted roof concept should require little or no maintenance, other than annual removal of any plants (in the case of gravel/paving finish), cleaning/checking of water outlets and gutters if necessary and checking that the gravel ballast is still in place and not interfering with or blocking gullies or outlets. Any displaced ballast, for example by wind scouring, should be promptly returned to its original state.

11.2 The use of chemicals (eg weed killers) should be checked for compatibility with the insulation, water-control membrane and deck waterproofing layer. The Certificate holder can advise on the suitability of a particular product.

11.3 Should a leak occur in the waterproof membrane, it must be repaired following removal of the gravel ballast or paving ballast layer, water-control membrane, and the insulation boards. Correct reinstatement of these layers must be carried out, taking care not to damage the water-control membrane.

12 Durability

12.1 XENERGY SL-EP Inverted Roof Insulation is rot resistant and, as long as the XENERGY MK watercontrol membrane remains undamaged, will have a life of at least 25 years under normal circumstances.

12.2 Care must be taken to ensure that the gravel ballast or paving, once installed, provides cover to the insulation and the XENERGY MK water-control membrane at all times to avoid the risk of UV degradation.

Installation

13 General

13.1 XENERGY SL-EP Inverted Roof Insulation should be installed in accordance with the relevant guidance in section 4 of this Certificate, providing adequate load-bearing capacity, falls, drainage, sound roof waterproofing and limited risk of condensation.

13.2 The insulation product is laid in accordance with the Certificate holder's instructions. The product is light and may be installed in any weather but, due to its size, care will be needed in high winds. Installers must not carry it near to parapets or apertures in the deck and, once placed the product must be covered with the XENERGY MK water-control membrane and ballasted as soon as possible.

13.3 Boards are laid in a brick bond pattern, and it is essential that all joints between the boards are tight and no gaps exist where they meet rooflights, edge details and other services which perforate the roof deck. The product can be cut easily using a handsaw or a knife.

13.4 The XENERGY MK water-control membrane should be loose laid over the insulation, at right angles to the slope, with 300 mm unsealed lap joints running down the slope. At upstands and penetrations the XENERGY MK membrane should be turned up to finish above the surface of the ballast later and turned down at drainage outlets.

13.5 The ballast loading layer should be installed in accordance with BS 6399-2 : 1997, BRE Digest 295 : 1985 and BRE Digest 311 : 1986.

13.6 The ballast loading layer must be applied as work progresses to protect the insulation and the filter/water-control layer from the effects of wind uplift and solar degradation. The ballast must not be stacked in one place on the roof unless the roof is strong enough to support it.

Upgrading roofs

13.7 In existing roofs (see Figure 6 in section 14.7), all requirements of sections 13.1 to 13.6 apply and, in addition, the existing roofing and substructure must be examined for degradation and, where necessary, repairs effected. Particular consideration should be given to the condensation risk that the existing roof structure may present. See section 7 of this Certificate.

13.8 Where, for example, parapets, details and services have insufficient height to accommodate the increased depth of insulation/protection, due provision needs to be made (ie a minimum of 150 mm from the top of the gravel to the top of the skirtings). If upgrading involves laying the product on existing inverted roof insulation, the advice of the Certificate holder should be sought.

13.9 Rainwater outlets will need to be modified or replaced to suit, eg by the installation of gravel guards.

14 Procedure

14.1 Typical construction details are given in Figures 2, 3, 4 and 5.

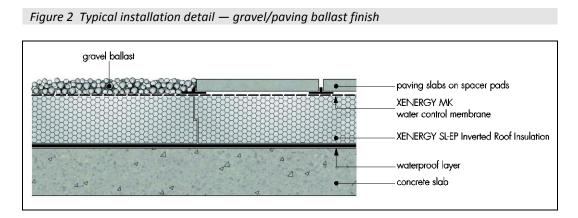

Figure 3 Water outlet detail — gravel finish

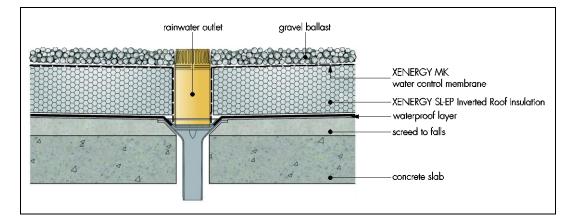

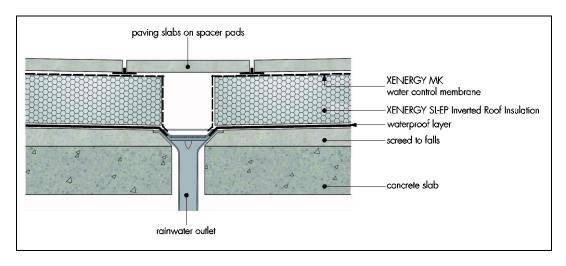

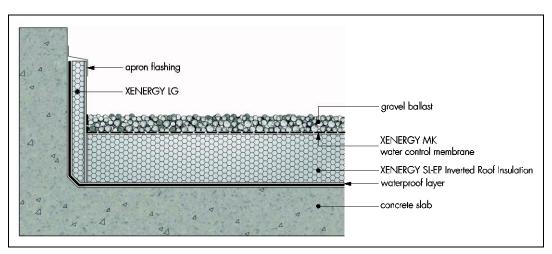

Figure 4 Water outlet detail — paving finish

14.2 It is essential to establish that the roof waterproofing has been installed correctly and that it is weathertight. Every joint between sheets, flashing and other details must be checked to ensure that the roof covering is suitable for an inverted roof specification.

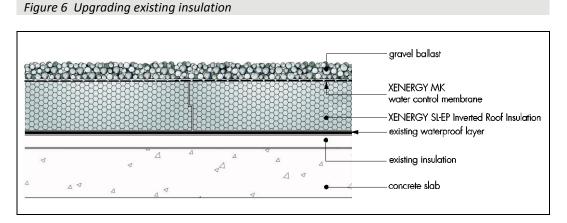

14.3 Single-layer roofing must be the subject of very close scrutiny, and the inspection must include an examination for perforation and for the likelihood of subsequent perforation from beneath by, for example, uneven decks and protruding nail heads. When a single-layer, polymeric loose-laid waterproofing membrane is used, a cushion layer should be interposed between it and the roof deck.

14.4 The roof waterproofing must be clean and free from any extraneous matter.

14.5 When the product is to be placed over a loose-laid roof covering, it should be installed and ballasted as soon as possible to protect the covering from the effects of wind uplift. See also sections 4.4, 4.5 and 4.6 of this Certificate.

14.6 Installers of the product must take care not to damage the roof waterproofing, particularly in the case of thin single-layer materials which may be easily damaged.

14.7 The XENERGY SL-EP Inverted Roof Insulation and the XENERGY MK membrane are laid in accordance with the Certificate holder's instructions and sections 13.2 to 13.4 of this Certificate.

cate holder's instructions and sections 13.2 to 13.4 of this Certifica

14.8 The ballast layer comprising either a gravel ballast (see sections 4.3 to 4.5) or paving slabs (see section 4.6) is then to be laid over the XENERGY MK water-control layer, as soon as possible to prevent flotation, wind uplift and UV degradation,

15 Tests

An examination of test data was made to determine:

- thermal conductivity
- compressive strength
- water vapour permeability
- long-term water absorption by diffusion
- water absorption by total immersion.
- resistance to freeze-thaw of the thermal insulation
- water flow through an inverted roof kit
- deformation under specified compressive load and temperature
- dimensional stability
- reaction to fire classification.

16 Investigations

16.1 A series of U value calculations were carried out.

16.2 A calculation was undertaken to confirm the declared and design thermal conductivity.

16.3 The manufacturing process was evaluated, including the methods adopted for quality control, and details were obtained of the quality and composition of materials used.

Bibliography

BS 5250 : 2011 Code of practice for control of condensation in buildings

BS 6229 : 2003 Flat roofs with continuously supported coverings — Code of practice

BS 6399-2: 1997 Loading for buildings — Code of practice for wind loads

BS 8217 : 2005 Reinforced bitumen membranes for roofing — Code of practice

BS 8218 : 1998 Code of practice for mastic asphalt roofing

BS 8417 : 2011 Preservation of wood — Code of practice

BS 8747 : 2007 Reinforced bitumen membranes (RBMs) for roofing — Guide to selection and specification

BS EN 1991-1-2 : 2002 Eurocode 1 — Actions on structures — General actions — Actions on structures exposed to fire

BS EN 1991-1-4 : 2005 Eurocode 1 — Actions on structures — General actions — Wind actions NA to BS EN 1991-1-4 : 2005 UK National Annex to Eurocode 1 : Actions on structures — General actions — Wind actions

BS EN 12056-3 : 2000 Gravity drainage systems inside buildings — Roof drainage, layout and calculation

BS EN 13164 : 2012 Thermal insulation products for buildings — Factory made extruded polystyrene (XPS) products — Specification

BS EN 13501-1 : 2007 Fire classification of construction products and building elements —Classification using test data from reaction to fire tests

BS EN 15026 : 2007 Hygrothermal performance of building components and building elements — Assessment of moisture transfer by numerical simulation

BS EN ISO 6946 : 2007 Building components and building elements — Thermal resistance and thermal transmittance — Calculation method

BS EN ISO 9001 : 2008 Quality management systems — Requirements

BRE Digest 295 : 1985 Stability under wind loads of loose-laid external roof insulation boards

BRE Digest 311 : 1986 Wind scour of gravel ballast on roofs

- BRE Report BR 262 : 2002 Thermal insulation: avoiding risks
- BRE Report BR 443 : 2006 Conventions for U-value calculations

LRWA Guidance Note No.7 : 2012 — Specifier Guidance for Flat Roof Falls

17 Conditions

17.1 This Certificate:

- relates only to the product/system that is named and described on the front page
- is issued only to the company, firm, organisation or person named on the front page no other company, firm, organisation or person may hold claim that this Certificate has been issued to them
- is valid only within the UK
- has to be read, considered and used as a whole document it may be misleading and will be incomplete to be selective
- is copyright of the BBA
- is subject to English Law.

17.2 Publications, documents, specifications, legislation, regulations, standards and the like referenced in this Certificate are those that were current and/or deemed relevant by the BBA at the date of issue or reissue of this Certificate.

17.3 This Certificate will remain valid for an unlimited period provided that the product/system and its manufacture and/or fabrication, including all related and relevant parts and processes thereof:

- are maintained at or above the levels which have been assessed and found to be satisfactory by the BBA
- continue to be checked as and when deemed appropriate by the BBA under arrangements that it will determine
- are reviewed by the BBA as and when it considers appropriate.

17.4 The BBA has used due skill, care and diligence in preparing this Certificate, but no warranty is provided.

17.5 In issuing this Certificate the BBA is not responsible and is excluded from any liability to any company, firm, organisation or person, for any matters arising directly or indirectly from:

- the presence or absence of any patent, intellectual property or similar rights subsisting in the product/system or any other product/system
- the right of the Certificate holder to manufacture, supply, install, maintain or market the product/system
- actual installations of the product/system, including their nature, design, methods, performance, workmanship and maintenance
- any works and constructions in which the product/system is installed, including their nature, design, methods, performance, workmanship and maintenance
- any loss or damage, including personal injury, howsoever caused by the product/system, including its manufacture, supply, installation, use, maintenance and removal
- any claims by the manufacturer relating to CE marking.

17.6 Any information relating to the manufacture, supply, installation, use, maintenance and removal of this product/system which is contained or referred to in this Certificate is the minimum required to be met when the product/system is manufactured, supplied, installed, used, maintained and removed. It does not purport in any way to restate the requirements of the Health and Safety at Work etc. Act 1974, or of any other statutory, common law or other duty which may exist at the date of issue or reissue of this Certificate; nor is conformity with such information to be taken as satisfying the requirements of the 1974 Act or of any statutory, common law or other duty of care.
