

Continuity waterproofing/Reducing Risk

Delta Membrane Systems Limited's new 'Detailing' brochure seeks to bridge best practice with techniques and products to ensure continuity of waterproofing systems and project success.

Delta's newest edition of brochure offers architects, specifiers, developers, contractors and homeowners' advice on continuous waterproofing solutions. In its most basic form, Delta's newest edition is instinctive - a wet basement requires remedial works, if there is an active leak, it requires stopping - whilst it is understood that there are numerous waterproofing solutions available, are these systems and solutions continuous and able to withstand the test of time and offer durability to the structure life cycle?

The main objective of this brochure is to provide some steps that can be immediately followed in any kind of structural waterproofing project to reduce the risks, to facilitate understanding and to improve the expected results. Common defects within structural waterproofing systems are estimated to cost £25 million per annum in the United Kingdom. Delta believes that the waterproofing sector can achieve near zero defects, by adopting successful continuous waterproofing techniques along with applying the correct built philosophy whilst utilizing best practice which all will influence the success of a project.

The new Detailing brochure compliments Delta's already, extensive collection of brochures which envelop the structural waterproofing industry, including Podium Decks, Flood Resilience, Type C Systems.

This contemporary, 48-page brochure includes BS8102:2009 Design Philosophy, photography of good detailing that showcase an array of techniques, products and how they can be incorporated to achieve a continuous/continuity waterproofing solution. Resources to anticipate defects in systems and principles to detect and manage the same.

Do you have questions about your project, product or applications? Does your project require a new approach? Does your waterproofing system work as it is supposed to? Then contact our technical team - send an email, call us or use our contact us form.

Take a few minutes so that we can support you as efficiently as possible:

- Tell us the name of the product you have questions about
- Tell us about the project you require assistance with
- Give a short description of any defective issues you currently have with your waterproofing system

We are always here for you!
